

PROFESSIONAL SUMMARY

Computer Science graduate with experience building and debugging software using Python, C++, Java, and TypeScript. Experienced in software development, APIs, Linux, databases, and AI/LLM systems through research and project environments.

CORE SKILLS

Programming: Python, C, C++, SQL/MySQL, Java , JavaScript/TypeScript, HTML/CSS
Systems & Development: Linux, Git, API Integration, Software Debugging, Object-Oriented Programming
Data & AI: Pandas, NumPy, Matplotlib, Neo4j, RAG, LLMs, Data Analysis
Languages: English, Mandarin

Education

Master of Science in Computer Science New Mexico State University – 3.97 GPA	Spring 2025–Fall 2025
Bachelor of Science in Computer Science New Mexico State University – 3.86 GPA	Spring 2022–Fall 2024
Associate of Science Doña Ana Community College – 3.9 GPA	Spring 2020–Spring 2022

Work Experience

NMSU – Research (Las Cruces, NM)	Jun. 2025–Sep. 2025
- Contributed to a Sandia-assigned research project studying TikTok and short-form video platforms. - Collected and reviewed posts to identify phishing and scam content, developed criteria to detect patterns, and built labeled datasets. - Conducted studies on how scam content spreads, including data gathering, annotation, and trend analysis. - Analyzed cleaned datasets with Python to uncover recurring scam strategies and user engagement behaviors, supporting Sandia’s broader research on digital risks.	
NMSU – Research (Las Cruces, NM)	Jan. 2025–May 2025
- Contributed as a member of the NMSU AI research team in collaboration with the University of North Carolina on the NAMAC system for advanced nuclear reactor control. - Developed and tested a Python-based RAG knowledge retrieval pipeline integrating technical documents, LLMs, and a Neo4j knowledge graph. - Troubleshoot inconsistent embedding outputs in the RAG pipeline by isolating the issue, reviewing technical documentation, and identifying incorrect documented syntax that caused unexpected behavior. - Mentored an undergraduate student by introducing research methodology, guiding literature review, and teaching hands-on techniques in Neo4j and knowledge graph construction.	

Projects

Rust and Rescue - Software/Hardware Integration Project	<u>Godot, GDScript, Arduino</u>
- Designed and developed Rust and Rescue, a mobile game for Android built in Godot, highlighting rescue missions to raise awareness of endangered wildlife in the American Southwest. - Implemented core gameplay mechanics in GDScript, including GPS-based movement, player–world interactions, and rescue event triggers.	

- Integrated an Arduino-based pressure sensor and plushy as a custom physical input device, simulating real rescue tools to enhance immersion.
- Debugged and refined interactions between gameplay logic, GPS-based movement, and Arduino hardware during development.

Bartender - Cocktail Recipe Web Application

React, TypeScript, Axios, Tailwind

- Developed a web application that allows users to search cocktail recipes by name, flavor, and ingredients.
- Integrated an external API using Axios and asynchronous requests to retrieve and display recipe data.
- Built responsive UI components with React, TypeScript, and Tailwind CSS.

Othello – Web-Based Strategy Game

JavaScript, HTML, CSS

- Developed a browser-based Othello game using JavaScript, HTML, and CSS.
- Implemented and tested core game logic including legal move validation, directional piece flipping, scoring, turn management, and win/tie detection.

Extracurricular

- Founder and secretary of the International Collaborative Coding Club (ICCC) at NMSU
 - Organized club activities and coordinated collaborative software projects among members.
